

Known Issues

Sometimes issues crop up, and we list them here with their solutions

Browser issues

Hover over graph on Wattmon in Firefox 52+

Firefox recently changed automatic detection of touchscreens when they released v52.0. This affects the hover values because Firefox won't show the hover values if it thinks a touchscreen is being used. To make a long story short, changing this configuration value fixes the problems on systems where Firefox thinks a touchscreen is enabled:

- `about:config`
- Search `"dom.w3c_touch_events.enabled"`
- Modify value 2 → 0

Graph page does not show updated values

Sometimes browser caches cause graph pages in [Wattmon](#) to show older data. If you are on a graph page (battery status, energy in Watts) and you are seeing old data, press `Ctrl + Shift + R` to force reload the page.

Temperature Sensor

In some situations, the Onewire temperature sensor does not give values when over 70 degrees celsius. To solve this, edit `/config/onewire.ini` and add the line: `presence_pulse_delay=50` Under the `[general]` section. Save and reboot, and it should work. The default presence pulse delay is 35 uS.

Code issues

Blank Functions

Resolved in firmware ≥ 1.1098 on [WattmonPRO](#) and ≥ 2.1098 on [WattmonMEGA](#)

Blank functions cause errors in the [Wattmon](#) parser, with the message `Invalid } in file ...`

Example:

```
function myFunctionThatFails() {
```

```
}
```

Fix:

```
function myFunctionThatWorks() {  
    $x=1;  
}
```
