

# fseropen

WMPRO FW >= 1.0 WMMEGA FW >= 2.0

Open the serial port at the specified baud rate with optional parameters

## Description

```
int fseropen ( int $baud [, int $blocking [, int $invert [, int $parity ]]] )
```

Attempt to open the serial port, and return the file handle for future operations

## Parameters

**\$baud**: Rate in bits per second

**\$blocking**: Optional, if set to 1 read operations will block until data is available

**\$invert**: Optional

**\$parity**: Optional, 0 (even parity) or 1 (odd parity)

## Return Value

Upon success it returns a file handle which may be used together with the other file functions that require a handle such as `fgets()`, `fwrite()`, `fclose()` and `feof()`

If the attempt to open the serial port fails it will return 0

## Example

**Open the serial port at 115200 baud in non-blocking mode:**

```
<?
$fp=fseropen(115200);
if ($fp) {
    $res=fwrite($fp,"Hello from wattmon");
    if ($res) {
        print("An error occurred while trying to write to the port");
    }
    fclose($fp);
} else {
    print("Serial open failed");
}
```

?>
