strtolower

WMPRO, WMMINI FW >= 1.0 WMMEGA FW >= 2.0

Return the lowercase version of a **string**

Description

string strtolower (string $str)

This function converts all alphabetic characters in **str** to lowercase

Parameter

$str: The input **string**

Return Values

Lowercase **string**

Example

```
<?
  $str="Mary Had A Little Lamb and She LOVED It So";
  $str=strtolower($str);
  print $str; // Prints "mary had a little lamb and she loved it so"
?>
```

See Also

charat() - Return the ASCII code for a character in a **string** at an index

strlen() - Return the length of a **string**

strpos() - Return the position of the first occurrence of a needle in a haystack

strrpos() - Return the position of the last occurrence of a needle in a haystack

strtoupper() - Return the UPPERCASE version of a **string**

substr() - Return a sub-string of the passed str from start for len characters. If len is blank it will return the string until the end.

ucfirst() - Convert a **string** to lowercase except for the first character of each word
