

urlencode

WMMEGA FW >= 2.1179

URL-encode a string

Description

`string` urlencode (`string` \$data)

This function is convenient when encoding a string to be used in a query part of a URL, as a convenient way to pass variables to the next page.

Parameter

`$data`: `String` to be encoded

Return Values

`String` with certain characters encoded. Returns a string in which all non-alphanumeric characters except `-_.` have been replaced with a percent (%) sign followed by two hex digits and spaces encoded as plus (+) signs. It is encoded the same way that the posted data from a WWW form is encoded, that is the same way as in `application/x-www-form-urlencoded` media type.

Examples

```
<?
$data="#G(2BH) "
$send=urlencode($data);
print($send); // %23G%282BH%29
?>
```
