

# uPHP Reference

uPHP functions have an identical syntax to PHP functions in most cases. Below is a list of all the functions that have been implemented.

Certain additional functions are available as WattmonOS include files. For a list of these see [library\\_functions](#).

Click on the function name for further details:

FUNCTION NAME	PARAMETER(S)	RETURN	DESCRIPTION
<a href="#">adc_read</a>	int channel	int ADC value	Read an onboard ADC <a href="#">channel</a>
<a href="#">aes_decrypt</a>	string text, int length, string key, string iv	string with data	Return an AES-decrypted string
<a href="#">aes_encrypt</a>	string text, int length, string key, string iv	string with data	Return an AES-encrypted string
<a href="#">array</a>	mixed values ...	array	Create an <a href="#">array</a> , with optional <a href="#">values</a>
<a href="#">array_key</a>	array, int index	string key	Return the key for an <a href="#">array</a> index
<a href="#">array_keys</a>	array with key/value pairs	array of keys	Return keys for an <a href="#">array</a> that has key/value pairs
<a href="#">array_resize</a>	array indexed array, int length	none	Resize indexed <a href="#">array</a>
<a href="#">base64_decode</a>	string base64	string decoded or int 0	Decode a base64-encoded <a href="#">string</a>
<a href="#">base64_encode</a>	string to encode	string base64 or int 0	Return the base64-encoded version of a <a href="#">string</a>
<a href="#">call_user_func</a>	string function_name, mixed parameters ...	mixed result	Call a user defined function with optional <a href="#">parameters</a>
<a href="#">charat</a>	string, int index	int ASCII code	Return the ASCII code for a character in a <a href="#">string</a> at an <a href="#">index</a>
<a href="#">chdir</a>	string directory	int 0=OK	Change the current directory
<a href="#">chr</a>	int code	string 1 character	Return the character for an ASCII <a href="#">code</a>
<a href="#">clear_watchdog</a>			Clear the software watchdog timer
<a href="#">cos</a>	number radian_angle	float cosine	Return cosine of a <a href="#">radian_angle</a>
<a href="#">debug</a>	string output		Print to debug output
<a href="#">debugout</a>	int 0 or 1		Enable or disable debug messages
<a href="#">die</a>			Kill the script
<a href="#">disk_free_space</a>	int drive	int KiloBytes	Return free space on drive
<a href="#">disk_status</a>	int drive	int Status	Return mount status of drive
<a href="#">disk_total_space</a>	int drive	int KiloBytes	Return total space on drive
<a href="#">download</a>	string url	int res	Download a file in the background
<a href="#">download_info</a>		array info	Get info about ongoing download
<a href="#">download_state</a>		int status	Get state of download
<a href="#">error_reporting</a>	int verbosity		Set the debug output level
<a href="#">ereg</a>	string pattern, string content [, &array matches]	int	Perform a regex operation

FUNCTION NAME	PARAMETER(S)	RETURN	DESCRIPTION
exec	string script, int delay		Run a <a href="#">script</a> with an optional <a href="#">delay</a>
exec_action	mixed action	int 1=OK	Triggers a manually executable <a href="#">action</a> by id or name
explode	string, string delimiter	array	Turn a <a href="#">string</a> into an <a href="#">array</a>
f485open	int baud, int parity	int handle or 0	Open the RS-485 port at the specified <a href="#">baud</a> rate and <a href="#">parity</a>
fclose	int handle		Close a file, stream or socket
feof	int handle	int 1 or 0	Test if no more data is available in a file, stream or socket
fgets	int handle, int size	string or int -1	Return a single line from a file, stream or socket, with optional <a href="#">size</a> limit
file_exists	string filename	int 1 or 0	Check if a file exists
filesize	string filename or int handle	int bytes	Return the size of a file, or the number of unread bytes in a stream or socket
findfirst	string pattern, int attributes	array first file found	Start searching the current folder for files matching a <a href="#">pattern</a> and <a href="#">attributes</a>
findnext		array next file found	Return next matching file information (after a findfirst)
firmwareupdate			Initiate a firmware update sequence and reboot the device
floatval	mixed value	float value or int 0/1	Return the <a href="#">float</a> value of a <a href="#">number</a> or <a href="#">string</a>
flush	socket socket to flush		Flush current output or socket to the browser
fopen	string filename, string mode	int handle or 0	Open a file for reading or writing
fread	int handle, int bytes	string or int 0	Read <a href="#">bytes</a> from a file, stream or socket
fread_unpack	int handle, string format, int count, int interval	number	Write contents of an indexed array to a file in binary
freemem		int bytes	Return free memory space
freestack		int bytes	Return free stack space
fseek	int handle, int offset, int whence		Position the file pointer in an open file
fseropen	int baud, int blocking, int invert, int parity	int handle or 0	Open the serial port at the specified <a href="#">baud</a> rate with optional parameters
fsockopen	string host, int port, int timeout	int handle or 0	Open an internet socket connection with optional <a href="#">timeout</a>
ftell	int handle	int position	Return the current position of a file read/write pointer
ftp_command	string result	string command]	Send an FTP command
ftp_close	int result		Close an active connection with FTP server

<code>ftp_download</code>	<code>int result</code>	<code>string remote_file, string local_file, [int position]</code>	Initiate a download of a remote file
<code>ftp_error</code>	<code>int result</code>		Get last FTP response code
<code>ftp_is_busy</code>	<code>int result</code>		Check if the FTP engine is busy
<code>ftp_is_connected</code>	<code>int result</code>		Check if the FTP connection is active
<code>ftp_is_connecting</code>	<code>int result</code>		Check if the FTP connection is in the process of connecting
<code>ftp_list</code>	<code>int result</code>	<code>string folder, string output_file</code>	Lists a folder on the FTP server and outputs the result to the specified file
<code>ftp_open</code>	<code>int result</code>	<code>string host, int port, string username, string password, int keepalive, int ignore_reply</code>	Open a connection to an FTP server
<code>ftp_size</code>	<code>int size</code>	<code>string filename</code>	Get the file size of a file on the FTP server
<code>ftp_status</code>	<code>array status</code>		
<code>ftp_upload</code>	<code>int result</code>	<code>string remote_file, string local_file, [int position]</code>	Initiate an upload of a file
<code>function_exists</code>	<code>string function_name</code>	<code>int 1 or 0</code>	Check if a function exists (custom or native)
<code>fwrite</code>	<code>int handle, mixed data, int length</code>	<code>int bytes written or -1</code>	Write <code>data</code> to a file, stream or socket
<code>fwrite_pack</code>	<code>int handle, array data, int length</code>	<code>number</code>	Write contents of an indexed array to a file in binary
<code>get3gstat</code>		<code>array</code>	Get cellular data connection status information
<code>getcwd</code>		<code>string path</code>	Get the current directory
<code>getethstat</code>		<code>array</code>	Get Ethernet connection status information
<code>getmac</code>		<code>string MAC</code>	Get the Wattmon's MAC address
<code>gettype</code>	<code>any variable</code>	<code>string type</code>	Get a variable type as a string
<code>getusbstat</code>		<code>array</code>	Get USB host status information
<code>getwifistat</code>		<code>array</code>	Get WIFI status information
<code>header</code>	<code>string header_data</code>		Add to HTTP header
<code>hash_hmac</code>	<code>string algorithm, string data, string key</code>	<code>string converted</code>	Generate a keyed hash value using the HMAC method
<code>htmlspecialchars</code>	<code>string data</code>	<code>string converted</code>	Convert special characters for display in HTML
<code>ieee754toint</code>	<code>float value</code>	<code>int representation</code>	Convert a <code>float value</code> to an IEEE-754 encoded <code>integer</code> (32 bit)
<code>implode</code>	<code>array, string delimiter</code>	<code>string</code>	Turn an <code>array</code> into a <code>string</code>
<code>include</code>	<code>string filename</code>		Include a file within the current script at the current location

<a href="#">indexed_array</a>	<code>int type, int size</code>	array	Create an <a href="#">array</a> of a specific <a href="#">type</a> and <a href="#">size</a>
<a href="#">ini_get</a>	<code>string filename, string section, string key, mixed default</code>	mixed value	Get a value from an INI file
<a href="#">ini_get_array</a>	<code>string filename, string section</code>	array	Get a group of parameters from an INI file as an <a href="#">array</a>
<a href="#">ini_put_array</a>	<code>string filename, array data, string section</code>		Write a group of parameters to an INI file from an <a href="#">array</a>
<a href="#">ini_set</a>	<code>string filename, string section, string key, mixed value</code>	<code>int 1=OK</code>	Set a <a href="#">value</a> in an INI file
<a href="#">init_watchdog</a>	<code>int interval</code>		Initialize the software watchdog timer
<a href="#">inttoieee754</a>	<code>int representation</code>	float value	Convert an IEEE-754 encoded <a href="#">integer representation</a> (32 bit) to a <a href="#">float</a>
<a href="#">intval</a>	<code>mixed value</code>	<code>int value</code>	Return the <a href="#">integer</a> value of a <a href="#">number</a> or <a href="#">string</a>
<a href="#">is_array</a>	<code>mixed variable</code>	<code>int 1 or 0</code>	Check if a <a href="#">variable</a> is an <a href="#">array</a>
<a href="#">is_float</a>	<code>mixed variable</code>	<code>int 1 or 0</code>	Check if a <a href="#">variable</a> is a <a href="#">float</a>
<a href="#">is_int</a>	<code>mixed variable</code>	<code>int 1 or 0</code>	Check if a <a href="#">variable</a> is an <a href="#">integer</a>
<a href="#">is_numeric</a>	<code>mixed value</code>	<code>int 1 or 0</code>	Check if a <a href="#">value</a> is numeric ( <a href="#">int</a> , <a href="#">float</a> or numeric <a href="#">string</a> )
<a href="#">is_string</a>	<code>mixed variable</code>	<code>int 1 or 0</code>	Check if a <a href="#">variable</a> is a <a href="#">string</a>
<a href="#">isset</a>	<code>mixed variable</code>	<code>int 1 or 0</code>	Check if a <a href="#">variable</a> exists
<a href="#">json_encode</a>	<code>array, int method</code>	string	JSON encode an <a href="#">array</a> into a <a href="#">string</a> , with optional <a href="#">method</a>
<a href="#">ln</a>	<code>number number</code>	float $\log_e$	Return the natural logarithm of a <a href="#">number</a>
<a href="#">log</a>	<code>string output, string file</code>		Print to the System Log (or optional <a href="#">file</a> )
<a href="#">log10</a>	<code>number number</code>	float $\log_{10}$	Return the base 10 logarithm of a <a href="#">number</a>
<a href="#">mail</a>	<code>string recipient, string subject, string body</code>	<code>int 0 or SMTP error code</code>	Send an email [deprecated]
<a href="#">max_execution_time</a>	<code>int seconds</code>		Set the maximum execution time for the current script
<a href="#">mb_add_dev</a>	<code>int id, int type, string name, int poll_interval, int status, int bus</code>	<code>int 0=OK</code>	Add a device to the list of polled devices
<a href="#">mb_delete_dev</a>	<code>int id</code>	<code>int 1=OK</code>	Delete a device from the list of active devices
<a href="#">mb_get_dev_by_id</a>	<code>int id</code>	array	Return modbus device details by <a href="#">id</a>
<a href="#">mb_get_dev_by_index</a>	<code>int index</code>	array	Return modbus device details by <a href="#">index</a>
<a href="#">mb_get_dev_by_name</a>	<code>string name</code>	array	Return modbus device details by <a href="#">name</a>

<a href="#">mb_get_dev_info</a>	<code>int type</code>	<code>array</code>	Return modbus device details by <code>type</code>
<a href="#">mb_get_role_array</a>		<code>array</code>	Return an <code>array</code> of all roles and their values
<a href="#">mb_get_status_by_role</a>	<code>int role</code>	<code>int 1=OK</code>	Return status of the device attached to the <code>role</code>
<a href="#">mb_get_val_by_role</a>	<code>int role</code>	<code>number</code>	Return value of the <code>role</code>
<a href="#">mb_num_devices</a>		<code>int</code>	Return number of devices on the modbus
<a href="#">mb_queue_command</a>	<code>mixed values ...</code>	<code>array</code> of numbers	Queue a sequence of characters to the RS-485 bus and get but ignore the reply
<a href="#">mb_scan_complete</a>		<code>int 1=complete, 0=ongoing</code>	Check to see if a modbus scan has completed
<a href="#">mb_scan_percent</a>		<code>number percent completed</code>	Return scan percentage completed
<a href="#">mb_send_command</a>	<code>mixed values ...</code>	<code>array</code> of numbers	Send a sequence of characters to the RS-485 bus and get a reply
<a href="#">mb_set_dev_var</a>	<code>string name or int id, string variable, mixed value</code>	<code>int 1=OK</code>	Set a <code>variable</code> on a modbus device
<a href="#">mb_set_val_by_role</a>	<code>int role, number value</code>	<code>int 1=OK</code>	Set a <code>role value</code> on a modbus device
<a href="#">mb_start_scan</a>	<code>int start, int end</code>		Initiate an automatic scan of the modbus
<a href="#">md5</a>	<code>string input</code>	<code>string</code> 32 characters	Calculate the MD5 hash of a <code>string</code>
<a href="#">md5_file</a>	<code>string filename</code>	<code>string</code> 32 characters	Calculate the MD5 hash of a file
<a href="#">mem_dump</a>			Write the current memory map to /dump.txt
<a href="#">mem_usage</a>			Write memory usage to standard output
<a href="#">microtime</a>		<code>int ms</code>	Return the number of milliseconds since boot
<a href="#">mkdir</a>	<code>string pathname</code>	<code>int 0 or error code</code>	Make a directory
<a href="#">mktime</a>	<code>int hour, int minute, int second, int month, int day, int year</code>	<code>int seconds</code>	Return the Linux Timestamp for a given date and time
<a href="#">mqtt_disconnect</a>			Disconnect MQTT connection
<a href="#">mqtt_publish</a>	<code>string channel, string content</code>	<code>int 1 for success or 0 for error</code>	Publish a message to an MQTT server
<a href="#">mqtt_subscribe</a>	<code>string channel, string callback</code>	<code>int 1 for success or 0 for error</code>	Subscribe to a channel on an MQTT server
<a href="#">mqttstat</a>		<code>array</code> array with connection status	Get MQTT Connection status
<a href="#">net_disable3g</a>			Disable 3G support for the dongle
<a href="#">net_enable3g</a>			Enable 3G support for the dongle

<a href="#">netstat</a>		array	Get Ethernet information
<a href="#">number_format</a>	mixed number, int digits	string formatted	Return the <b>string</b> value of a <b>number</b> formatted to a particular precision
<a href="#">nvram_backup</a>	string filename	int bytes written or 0=error	Backup the contents of NVRAM to a file on the SD Card
<a href="#">nvram_defrag</a>			Defragment NVRAM to optimise it
<a href="#">nvram_dump</a>			Dump the contents of NVRAM to standard output
<a href="#">nvram_free</a>		int bytes	Return the number of bytes available in NVRAM
<a href="#">nvram_get</a>	string key	mixed value	Get a value from NVRAM
<a href="#">nvram_restore</a>	string filename		Restore the contents of NVRAM from a file
<a href="#">nvram_set</a>	string key, string value	int 1=OK	Set a <b>key</b> and <b>value</b> in NVRAM
<a href="#">nvram_unset</a>	string key	int 1=OK	Clear a <b>key</b> from NVRAM
<a href="#">ord</a>	string character	int ASCII code	Return the ASCII code for a character
<a href="#">ow_first</a>		array or int 0	Initiate a OneWire bus scan and return the address of the first device found
<a href="#">ow_next</a>		array or int 0	Return the address of the next OneWire device found (after an <a href="#">ow_first</a> )
<a href="#">ow_read</a>		int value or 0	Read a byte from the OneWire bus
<a href="#">ow_read_temp</a>	array device_id	float degrees Celsius	Read a temperature from a device on the OneWire bus
<a href="#">ow_reset</a>			Reset the OneWire bus
<a href="#">ow_write</a>	int value		Write a byte to the OneWire bus
<a href="#">pack</a>	string format, mixed value	string	Pack a value into a <b>string</b>
<a href="#">phpinfo</a>		string	Return information about the system
<a href="#">pin_configure</a>	int pin_index, int pin_type, int counter_type		Configure an I/O pin as a digital input, output, or analog input
<a href="#">pin_get</a>	int pin_index, int pin_type	int value	Return the value of an I/O pin
<a href="#">pin_set</a>	int pin_index, int value		Set a digital output to <b>value</b> 1 or 0
<a href="#">ping</a>	string host	array	Send an ICMP ping and place the result in an <b>array</b>
<a href="#">power</a>	number base, number exp	number base <sup>exp</sup>	Return <b>base</b> raised to the power of <b>exp</b>
<a href="#">print</a>	string data		Print <b>data</b> to the current output stream such as a web page or terminal
<a href="#">print_r</a>	array		Dump the contents of an <b>array</b> to the current output

printf	string format, mixed values ...		Print a formatted string to standard output
process_kill	int pid		Send a kill request to a process
process_list		array	Return an array of the currently running scripts
rand	int min, int max	int	Return a random integer between min and max
reboot			Reboot the processor
register_callback	string callback_type, string filename, string functionname	int 0 or error code	Register a callback function for system events
rename	string source, string destination	int 0 or error code	Rename or move a file or directory from source to destination
reset			Reset the processor
rmdir	string pathname, int delete_contents	int 0=OK	Remove a directory, with optional deletion of contents
send_sms	string phone_number, string message	int result	sends an sms through a cellular dongle
session_destroy			Clear the current session's data
session_is_new	int		Check if a session was just initiated
session_start			Initiate a new session and send the cookie data for it
native_set_cert_key	string key, string cert		Set a custom certificate encryption key
set_search_path	string pathname		Set the search path for the telnet client
setethpower	int state		Enable or disable the ethernet controller
setpriority	int priority		Set the priority of the current script
settime	int timestamp, int calibration		Set the system time from a Linux Timestamp, with optional calibration
setusbpower	int state		Enable or disable USB power
sha1	string input	string 40 characters	Calculate the SHA1 hash of a string
sin	number radian_angle	float sine	Return sine of a radian_angle
sizeof	array	int number of elements	Return the number of elements in an array
sleep	int ms		Sleep for specified milliseconds
snmp_trap_send	string message	int 0 or 1	Send an SNMP trap message with ASCII content of source
spi_clearcs			Clear the CS output of the SPI bus
spi_read	int byte		Read a byte from the SPI bus
spi_setscs			Set the CS output of the SPI bus
spi_write	int byte		Write a byte to the SPI bus
sprintf	string format, mixed values ...	string formatted	Return a formatted string
sqr	number number	number squared	Return the square of a number
sqrt	number number	number square root	Return the square root of a number

<a href="#">stats</a>		array	Return system statistics
<a href="#">str_replace</a>	string <code>search</code> , string <code>replace</code> , string <code>subject</code> , [int &count]	string result	Return the string with each occurrence of <code>search</code> replaced with <code>replace</code>
<a href="#">strftime</a>	string <code>format</code> , int <code>timestamp</code>	string formatted	Format a Linux <code>Timestamp</code> using a <code>format string</code>
<a href="#">strlen</a>	string <code>input</code>	int length	Return the length of a <code>string</code>
<a href="#">strpos</a>	string <code>haystack</code> , string <code>needle</code>	int position or -1	Return the position of the first occurrence of a <code>needle</code> in a <code>haystack</code>
<a href="#"> strrpos</a>	string <code>haystack</code> , string <code>needle</code>	int position or -1	Return the position of the last occurrence of a <code>needle</code> in a <code>haystack</code>
<a href="#">strtolower</a>	string <code>input</code>	string lowercase	Return the lowercase version of a <code>string</code>
<a href="#">strtoupper</a>	string <code>input</code>	string UPPERCASE	Return the UPPERCASE version of a <code>string</code>
<a href="#">strval</a>	mixed <code>value</code>	string	Return the <code>string</code> equivalent of a <code>number</code>
<a href="#">substr</a>	string <code>input</code> , int <code>start</code> , int <code>length</code>	string substring	Return part of a <code>string</code>
<a href="#">tar_finish</a>	int <code>handle</code>	int 1=OK	Add the ending header to a TAR file
<a href="#">tar_put</a>	int <code>handle</code> , string <code>src.pathname</code> , string <code>tar.pathname</code>	int 1=OK	Add a file to an open file in TAR format
<a href="#">time</a>		int seconds	Return the current system timestamp
<a href="#">timefromfat</a>	int <code>filetime</code>	int seconds	Convert a FAT <code>filetime</code> to a Linux Timestamp
<a href="#">trim</a>	string <code>input</code>	string trimmed	Return the trimmed <code>string</code>
<a href="#">ucfirst</a>	string <code>input</code>	string Lowercase	Convert a <code>string</code> to Lowercase except for the first character
<a href="#">unlink</a>	string <code>filename</code>	int 0 or error code	Remove a file (delete it)
<a href="#">untar</a>	string <code>filename</code> , int <code>verbosity</code>	int 1=OK	Expand a TAR file into the current folder, optionally verbose
<a href="#">unpack</a>	string <code>format</code> , string <code>value</code>	number	Unpack a packed string value and return the original data
<a href="#">uptime</a>		int ms	Return the uptime in milliseconds
<a href="#">urldecode</a>	string <code>str</code>	string string to encode	URL-Decode a string
<a href="#">urlencode</a>	string <code>str</code>	string encoded string	URL-Encode a string
<a href="#">wifi_disable</a>			Disable Wifi module
<a href="#">wifi_enable</a>			Enable Wifi module
