

rename

WMPRO, WMMINI FW \geq 1.0 WMMEGA FW \geq 2.0

Rename or move a file or directory from **source** to **destination**

Description

```
int rename ( string $source, string $destination )
```

This function attempts to rename or move a file or directory from **source** to **destination**, moving it between directories if necessary. Relative paths are supported for both parameters: using a / at the beginning will make it relative to the root, otherwise it will be relative to the current working directory, which is either the folder that the script was started in or as was set by `chdir()`.

Parameters

\$source: File or directory to be renamed or moved

\$destination: The new path and/or name

Return Values

Integer: 0=success, otherwise error code

See Also

[chdir\(\)](#) - Change the current directory

[getcwd\(\)](#) - Get the current directory

[mkdir\(\)](#) - Make a directory

[rmdir\(\)](#) - Remove a directory, with optional deletion of contents

[unlink\(\)](#) - Remove a file (delete it)
